                                                                                                                                  2 DNA sequences (AAT62512 and AAT62513) respectively code for primatised forms (AAM01821 and AAW01822) of the light and heavy chain of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody forms (Cloned 16C10 1914) and heavy variable genes are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow produ. of primatised antibody in e.g. CHO cells. Primatised 7010 and 736 anti-B7.1 antibodies have also been produced (see also AAW01817-20). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 11, Appl Sequence 11, Appl Sequence 11, Appl

Description

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                            9
                                                                                   2 Polypeptides (AAW01821 and AAW01822) respectively comprise primatised forms of the light and heavy chains of cynomolgus monkey anti-human b7.1 antigen monoclonal antibody 16610. Cloned 16610 light and heavy variable genes (see also AAT62512 and AAT62513) are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of the primatised antibody in e.g. CHO cells. Primatised 7010 and 786 anti-B7.1 antibodies have also been produced (see also AAW01817-20). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Monoclonal antibody; Mab; macaque; heavy chain; primate; antigen; CD80; CD86; inhibitor; immunosuppressant; treatment; autoimmune disease; IL-2; T cell/B cell interaction; tumour; inflammation; imaging agent; vaccine; immunogen; anti-idiotype reagent; interleukin-2; IgG; immunoglobulin G;

This sequence represents a primatized form of the antibody 16010 heavy chain from macaque. This sequence is used in a method which studies new monotonal antibodies (MAD's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibite binding of these antigens to CD28. Such MaD's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoinmune disease, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type I diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, I filamentory bowel disease, allergy and multiple solenois, graft vs. Inflammatory bowel disease, allergy and multiple solenois, graft vs. host diseases, be cell lymphoma, infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the MAD can be conjugated to a drug or toxin. MAD's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAD's are optionally combined with other proteins or small molecule immunosuperessants. Blocking B7/CD28 interactions funduces long-term, antigen-specific immunosuperession, i.e. it inhibits production of interlenkin-2 (IL-2), T cell proliferation and antigen-specific immunoglobulin G (IGG) responses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PGKGLEWIGSFYSSSGNTYYNPSLKSQVTISTDTSKNQFSLKLNSMTAADTAVYYCVRDR 120

Sequence 12, Application US/08487550
Patent No. 6113898
GENERAL INFORMATION:
APPLICANT: Anderson, Darrell R.
TITLE OF INVENTION: "MONKEY MONOCLONAL ANTIBODIES SPECIFIC
TITLE OF INVENTION: TO HUMAN B7.1 AND/OR B7.2 PRIMATIZED FORMS THEREOF,
TITLE OF INVENTION: PHARMACETTIAL COMPOSITIONS CONTAINING, AND USE THEREOF AS TITLE OF INVENTION: IMMUNOSUPPRESANTS"
NUMBER OF SEQUENCES: 12
CORRESPONDENCE ADDRESS:
ADDRESSEE: BURNS, DOANE, SWECKER & MATHIS
STREET: 699 Prince Street
CITY: Alexandria
STREET: VA

Patent No. 6492134

GENERAL INFORMATION:
APPLICANT: Anderson, Darrell R.
TITLE OF INVENTION: "MONKEY MONOCLONAL ANTIBODIES SPECIFIC
TITLE OF INVENTION: TO HURMAN B7.1 AND/OR B7.2 PRIMATIZED FORMS THEREOF,
TITLE OF INVENTION: PHARMACEUTIAL COMPOSITIONS CONTAINING, AND USE THEREOF AS
TITLE OF INVENTION: IRMUNOSUPPRESANTS"
NUMBER OF SEQUENCES: 12
CORRESPONDENCE ADDRESS:
ADDRESSEE: BURNS, DOANE, SWECKER & MATHIS
STREET: 699 Prince Street

                                                                                                                                                                                                                                                                                                                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 1, A Sequence 5, A Sequence 9, A Sequence 9, A Sequence 9, A Sequence 20,

2 DNA sequences (AAT62509 and AAT62510) respectively code for primatised forms (AAW01817 and AAW01818) of the light and heavy chain of cynomolgus monkey anti-human B7.1 antigen monoclonal antibody 7C10. Cloned 7C10 light and heavy variable genes are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of primatised antibody in e.g. CHO cells. Primatised 7B6 and 16C10 anti-B7.1 antibodies have also been produced (see also AAW01819-22). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease. monoclonal antibody binding human $\rm B7.1~or~B7.2$ antigen for treating autoimmune disease or graft-versus-host disease Claim 7; Fig 8A; 81pp; English.

New monoclonal antibodies specific for B7.1 or B7.2 antigens and inhibiting binding to CD28 - useful as specific immunosuppressants for treating diseases that involve interactions between I and B cells, e.g. graft rejection or tumours

Example 7; Fig 3a; 87pp; English.

This sequence encodes a primatized form of the antibody 7010 light chain from macaque. This sequence is used in a method which studies new monoclonal antibodies (MAD's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such MAD's are specific immunosuppressants for treatment of diseases involving T cell/B cell interactions, particularly autoimmune diseases, specifically idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type in diabetes mellitus, rheumatoid arthritis, psoriasis, aplastic anaemia, inflammatory bowel diseases, allergy and multiple sclerosis, graft vs. host diseases, B cell lymphoma, infections (including by human immune MAD can be conjugated to a drug or toxin. MAD's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. MAD's are optionally combined with other proteins anti-idiotype reagents.

or small molecule immunosuppressants Blocking B7/CD28 interactions induces long-term, antigen-specific immunosuppression, i.e. it inhibits production of interleukin-2 (IL-2), T cell proliferation and antigen-specific immunoglobulin G (IgG) responses

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Cloned 7C10 light and heavy an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of the primatised antibody in e.g. CHO cells. Primatised 7R6 and 16C10 anti-B7.1 antibodies have also been produced (see also AAW01819-22). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders

This sequence represents a primatized form of the antibody 7C10 light chain from macaque. This sequence is used in a method which studies new moncolonal antibodies (Mab's) that bind selectively to B7.1 (CD80) or to B7.2 (CD86) antigens and inhibits binding of these antigens to CD28. Such Mab's are specific immunosuppressants for treatment of diseases involving really early inflammatory bardiants, systemic lupus erythematosus, type idiopathic thrombocytopaenia purpura, systemic lupus erythematosus, type inflammatory bowel disease, allergy and multiple solerosis, graft vs. Inflammatory bowel disease, allergy and multiple solerosis, graft vs. host diseases. B cell lymphoma infections (including by human immune deficiency virus) or inflammatory disease and tumours. Optionally the Mab can be conjugated to a drug or toxin. Mab's, or their fragments, can also be used as imaging agents and as vaccines or immunogens to develop anti-idiotype reagents. Mab's are optionally combined with other proteins or small molecule immunosuppressants. Blocking B7/CD28 interactions production of interleukin-2 (IL-2), T cell proliferation and antigen-specific immunosuppression, i.e. it inhibits antigen-specific immunosuppression and antigen-specific immunosuppression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180

Patent No. US20020177699A1

Patent No. US20020177699A1

GENERAL INFORMATION:

APPLICANT: Anderson, Darrell R.

TITLE OF INVENTION: "MONKEY MONOCLONAL ANTIBODIES SPECIFIC

TITLE OF INVENTION: "MONKEY MONOCLONAL ANTIBODIES SPECIFIC

TITLE OF INVENTION: "MONKEY MONOCLONAL ANTIBODIES SPECIFIC

TITLE OF INVENTION: PRARAACETIAL COMPOSITIONS CONTAINING, AND USE THEREOF AS INTER OF INVENTION: IMMUNOSUPPRESANTS"

NUMBER OF SEQUENCES: 12

CORRESPONDENCE ADDRESS:

ADDRESSE: BACKER & MATHIS

STREET: 699 Prince Street

CITY: Alexandria

STREET: VA

COUNTY: Alexandria

STREET: BW PC Compatible

COUNTY: Alexandria

STREET: BW PC COMPATIBLE

COMPUTER READABLE FORM:

MEDIUM TYPE: Ploppy disk

COMPUTER: Patentin Release #1.0, Version #1.30

CORRESPONDENCE: Patentin PC-DOS/MS-DOS

SOFTWARE: Patentin PC-DOS/MS-DOS

SOFTWARE: Patentin PC-DOS/MS-DOS

SOFTWARE: PAPLICATION NUMBER: US 09/383,916

FILING DATE:

FILING DATE:

REPERRORS/ACRATION NUMBER: 35,030

RESISTRATION NUMBER: 35,030

Cloned 7C10 light and heavy variable genes are inserted into an expression vector (pref. NEOSPLA) which contains human light and heavy chain constant region genes to allow prodn. of primatised antibodies have also been produced (see also AAW01819-22). The primatised antibodies inhibit the B7:CD28 pathway, making them useful immunosuppressants for the treatment of autoimmune disorders and graft-versus-host disease.
                                                                Monkey monoclonal antibody binding human B7.1 or B7.2 antigen useful for treating autoimmune disease or graft-versus-host disease
